Remark. Unless otherwise stated, all rings are commutative and unital.

1 Definitions

Definition 1.1. An element $p \in A$ is prime if (p) is a prime ideal. Equivalently p is prime if whenever $p \mid xy$ either $p \mid x$ or $p \mid y$.

Definition 1.2. An element $r \in A$ which is nonzero and not a unit is irreducible if whenever $r = xy$ either $x \in A^\times$ or $y \in A^\times$.

2 Domains

Definition 2.1. A ring A is a domain if A has no zero divisors i.e. if $ab = 0$ then $a = 0$ or $b = 0$.

Proposition 2.2. Let A be a domain then any nonzero prime element is irreducible.

Proof. Let $p \in A$ be a prime. Now suppose that $p = xy$ for $x, y \in A$. Thus, $p \mid xy$ so (WLOG) we have $p \mid x$ so $x = pz$ and thus $p = pzy$. However, p is nonzero and A is a domain so $zy = 1$ and thus $y \in A^\times$ proving that p is irreducible. $\square$

3 Principal Ideal Domains

Definition 3.1. A principal ideal domain (PID) is a domain A such that every ideal is principal.

Lemma 3.2. If A is a PID then A is Noetherian.

Proof. Every ideal is principal and thus finitely generated. $\square$

Lemma 3.3. Let A be a PID and $r \in A$ irreducible then (r) is maximal and thus r is prime.

Proof. Consider an intermediate ideal $(r) \subset J \subset A$ then since A is a PID we have $J = (a)$ so $r \in (a)$ and thus $r = ac$ so either $a \in A^\times$ in which case $J = A$ or $c \in A^\times$ in which case $J = (r)$ so (r) is maximal and thus a prime ideal. $\square$

Theorem 3.4. Let A be a PID and not a field then $\dim A = 1$.

Proof. Any prime ideal $\mathfrak{p} \subset A$ is principal so $\mathfrak{p} = (p)$ and p is prime. Either $p = 0$ which is prime since A is a domain or p is irreducible and so we have shown (p) is maximal. So every prime ideal is zero or maximal and thus $\dim A \le 1$. If $\dim A = 0$ then (0) is maximal so A is local and any nonzero element is thus invertible so A is a field. $\square$

Theorem 3.5 (Kaplansky)**.** Let A be Noetherian then A is a principal ideal ring iff every maximal ideal is prime.

Theorem 3.6 (Cohen)**.** A ring A is Noetherian iff every prime ideal is finitely generated.

Corollary 3.7. A ring A is a principal ideal ring iff every prime ideal is principal.

4 Unique Factorization Domains

Definition 4.1. A domain A is a unique factorization domain (UFD) if every nonzero element has a unique factorization into irreducible elements.

Definition 4.2. A factorization ring A is a ring such that every nonzero element has a factorization into irreducible elements.

Lemma 4.3. If A is a Noetherian domain then it is a factorization domain.

Proof. Take $a_0 \in A$. If a is irreducible, zero, or a unit then we are done. Then we can write, $a = a_1^{(1)} a_2^{(1)}$ for $a_1, b_1 \notin A^\times$. Continuing in this manner we get,

$$(a) \subsetneq (a_1^{(1)}, a_2^{(1)}) \subsetneq (a_1^{(2)}, a_2^{(2)}, a_3^{(2)}, a_4^{(3)}) \subsetneq \cdots$$

(CHECK THIS) This sequence is proper since if $a = bc$ and $b \in (a)$ then $a = arc$ so $rc = 1$ and thus $c \in A^\times$ contradicting our construction. However, A is Noetherian then the sequence must terminate so at some point the factorization must become irreducible. $\square$

Theorem 4.4. Let A be a factorization domain. Then A is a UFD iff every irreducible is prime.

Proof. If A is a UFD and p an irreducible. Let $x, y \in A$ and $p \mid xy$ then p is in the factorization of xy and thus, by uniqueness must be in the factorization of either x or y so $p \mid x$ or $p \mid y$.

Conversely, if A is a factorization domain and every irreducible is prime then given two factorizations of x each irreducible must, by primality, divide an irreducible in the other factorization so they are equal. (DO THIS BETTER) $\square$

Corollary 4.5. If A is a PID then A is a UFD.

Proof. If A is a PID then it is Noetherian and thus a factorization domain. Furthermore, every irreducible is prime so A is a UFD. $\square$

4.1 Height One Prime Ideals

Proposition 4.6. Let A be a Noetherian ring. Then any principal prime ideal has height at most one.

Proof. Let $\mathfrak{p} = (p) \subset A$ be a principal prime ideal. Then consider the localization which is $A_{(p)}$ Noetherian and the unique maximal ideal $pA_{(p)}$ is principal. Take $N = \text{nilrad}\left(A_{(p)}\right)$ then,

$$\dim A_{(p)}/N = \dim A_{(p)} = \mathbf{ht}\left(\mathfrak{p}\right)$$

but $A_{(p)}/N$ is a Noetherian domain and the unique maximal ideal $pA_{(p)}$ is principal so $A_{(p)}/N$ is a PID and thus $\dim A_{(p)}/N \leq 1$. $\square$

Proposition 4.7. If A is a UFD then every prime ideal of height one is principal.

Proof. Let $\mathfrak{p} \subset A$ be a prime ideal with $\mathbf{ht}\left(\mathfrak{p}\right) = 1$. Take any nonzero element $x \in \mathfrak{p}$ and consider its factorization into irreducibles. Since $\mathfrak{p}$ is prime some irreducible factor $p \mid x$ must be in $\mathfrak{p}$ so $(p) \subset \mathfrak{p}$. Since A is a UFD all irreducibles are prime so $(p) \subset \mathfrak{p}$ is prime. However $\mathbf{ht}\left(\mathfrak{p}\right) = 1$ and $(p) \neq (0)$ so $(p) = \mathfrak{p}$ and thus $\mathfrak{p}$ is principal. $\square$

Theorem 4.8. Let A be a Noetherian domain. Then A is a UFD iff every height one prime ideal is principal.

Proof. We showed one direction above. Conversely, suppose every height one prime ideal is principal. Since A is a Noetherian domain, it suffices to show that each irreducible is prime. Let r be irreducible and consider a minimal prime $\mathfrak{p} \supset (r)$. Then by Krull's Hauptidealsatz, $\mathfrak{p}$ has height one so by our assumption $\mathfrak{p} = (p)$ is principal. However, $(r) \subset (p)$ so $p \mid r$ but r is irreducible so we must have $(r) = (p) = \mathfrak{p}$ and thus r is prime. $\square$

Theorem 4.9 (Krull's Hauptidealsatz)**.** Let $I \subset A$ be an ideal in a Noetherian ring A with n generators then any minimal prime ideal $\mathfrak{p} \supset I$ has height at most n.
