# 1 Prismatic Cohomology

Our goal will be the following theorem about the topology of algebraic varities.

**Theorem 1.0.1.** et X be a smooth, proper,  $\mathbb{C}$ -variety with unramified good reduction at p. Let i < p-2 and  $W \subset X$  and Zariki open. Then the image of the restriction map,

$$H^i(X, \mathbb{F}_p) \to H^i(W, \mathbb{F}_p)$$

has dimension at least  $h_X^{0,i} := \dim H^0(X, \Omega_X^i)$ .

This statement amounts to showing that certain cohomology classes are not p-divisible.

There is a version with Q-coefficients that follows from Hodge theory.

**Theorem 1.0.2.** Let X be a smooth, proper, complex variety and  $W \subset X$  any Zariki open. Then the image of the restiction map,

$$H^i(X,\mathbb{Q}) \to H^i(W,\mathbb{Q})$$

has dimension at least  $h_X^{0,i} := \dim H^0(X, \Omega_X^i)$ .

*Proof.* The map  $H^i(X,\mathbb{Q}) \to H^i(W,\mathbb{Q})$  is a morphism of mixed hodge structures. Posibly passing to a log resolution  $\pi: \widetilde{X} \to X$  of  $Z = X \setminus W$  we may assume that  $\pi^{-1}(Z) = D$  is an snc divisor (note the birational modification does not change  $h_X^{0,i}$  and the map  $H^i(\widetilde{X},\mathbb{Q}) \to H^i(W,\mathbb{Q})$  factors through  $H^i(X,\mathbb{Q})$  so its image is the same). Then there is a commutative diagram,

where the top map is injective and the downward maps are injective. This immediately implies the claim.  $\Box$ 

The real power of our main result is that it works integrally. This has applications to essential dimension to be discussed later.

# 1.1 Mod-p Cohomology

We need the following about Delinge-Illusie's treatment of de Rham cohomology and basics of prismatic cohomology.

#### 1.1.1 Log de Rham cohomology

Let k be a perfect field of characteritic p, and let X be a smooth k-scheme. Suppose that X is equipped with a normal crossings divisor  $D \subset X$ . Let  $\Omega^{\bullet}_{X/k}(\log D)$  denote the de Rham complex with log poles in D.

Let  $(X^1, D^1)$  be the base change by Frobenius  $F_k : \operatorname{Spec}(k) \to \operatorname{Spec}(k)$  and  $F_{X/k} : X \to X^1$  denote the relative Frobenius. It is a finite flat map (since X is smooth) of k-schemes such that  $F_{X/k} : D \to D^1$ .

**Lemma 1.1.1.** Suppose that (X, D) admits a lift to  $W_2(k)$  called  $(\widetilde{X}, \widetilde{D})$  with  $\widetilde{D}$  a snc divisor flat over  $W_2(k)$ . Then for j < p,

$$H^0(X^1, \Omega^j_{X^1/k}(\log D^1)) \hookrightarrow H^j(X, \Omega^{\bullet}_{X/k}(\log D))$$

is canonically a direct summand.

*Proof.* This follows from the existence of the Cartier operator in the same way as in Deligne-Illusie.  $\Box$ 

#### 1.1.2 Prisms

Let K be a field of characteristic 0. By a p-adic valuation on K we mean a rank one valuation  $\nu$  on K, with  $\nu(p) > 0$ . We suppose that K is complete with respect to  $\nu$  with ring of integers  $\mathcal{O}_K$  and perfect residue field k. We will only recall exactly as much about prismatic cohomology as necessary.

**Definition 1.1.2.** A  $\delta$ -ring is a pair  $(R, \delta)$  where R is a commutative ring and  $\delta : R \to R$  is a set map such that,

- (a)  $\delta(0) = \delta(1) = 0$
- (b)  $\delta(xy) = x^p \delta(y) + y^p \delta(x) + p \delta(x) \delta(y)$
- (c)  $\delta(x+y) = \delta(x) + \delta(y) + \frac{x^p + y^p (x+y)^p}{p}$

Note that the last term exists as some universal polynomial with integer coefficients.

We think of this as a sort of "derivation along the *p*-direction". It is also related to lifting Frobenius on R/p. Indeed, if  $\phi(x) = x^p + p\delta(x)$  then  $\phi: R \to R$  is a ring map by property (c) and obviously it lifts  $x \mapsto x^p$  on R/p. In fact, if R is p-torsionfree then lifts of Frobenius are exactly the same as  $\delta$ -ring structures.

**Definition 1.1.3.** Let (A, I) be a pair where A is a  $\delta$ -ring and  $I \subset A$  is an ideal. The pair is a *prism* if

- (a)  $I \subset A$  is invertible (defines a Cartier divisor on Spec (A))
- (b) A is derived (p, I)-complete
- (c)  $p \in I + \phi(I)A$

**Example 1.1.4.** Let A be a p-torsionfree and p-complete  $\delta$ -ring then (A, (p)) is a prism.

**Example 1.1.5.** The *Breuil-Kisin* prism. Assume that  $\nu$  on K is discrete. Set A = W(k)[[u]] equipped with Frobenius  $\varphi$  extending Frobenius on W(k) by  $u \mapsto u^p$ . Equip A with the map  $A \to \mathcal{O}_K$  sending  $u \mapsto \pi$  some uniformizer. It kernel is generated by an Eisenstein polynomial  $E(u) \in W(k)[u]$  for  $\pi$ . In fact, in applications we will assume  $\mathcal{O}_K = W(k)$  and  $\pi = p$ . Then (A, E(u)A) is the Breuil-Kisin prism.

**Example 1.1.6.** Suppose that K is algebraically closed. Let  $R = \varprojlim \mathcal{O}_K/p$  taking the limit over Frobenius. We take A = W(R). Any element  $(x_0, x_1, \dots) \in R$  lifts uniquely to a sequence  $(\hat{x}_0, \hat{x}_1, \dots, ) \in \mathcal{O}_K$  with  $\hat{x}_i^p = \hat{x}_{i-1}$ . Then there is a natural surjective map of rings  $\theta : A \to \mathcal{O}_K$  sending a Teichmuller element x as above to  $\hat{x}_0$ . The kernel of  $\theta$  is principal, generated by  $\xi = p - [\underline{p}]$  where  $p = (p, p^{1/p}, \dots)$  then  $(A, \xi A)$  is an example of a perfect prism.

#### 1.1.3 Logarithmic Cohomology

We will use logarithmic formal schemes over  $\mathcal{O}_K$ . We will consider logarithmic étale cohomology meaning the natural cohomology on the site of log étale covers of logarithmic schemes. The main fact we will use is the following comparison result:

**Theorem 1.1.7.** Let k be an algebraically closed field and X a smooth k-scheme. Let  $D \subset X$  be an snc divisor and  $X_D^{\log}$  the log structure induced by D. Then there is a canonical isomorphism,

$$H^i_{\mathrm{\acute{e}t}}(X_D^{\log},\mu) \stackrel{\sim}{\longrightarrow} H^i(X \backslash D,\mu)$$

#### COEFFICIENTS

Proof. Idea: show that any finite étale map  $Y \to X \setminus D$  extends canonically to a finite log-étale map  $\overline{Y} \to X_D$  which proves the statment for i = 1 then use dimension shifting and some spectral sequence. To show the claim, take the normalization of Y in X which gives a finite map  $Y \to X$  ramified only over D by Zariski nagata purity. Then a local check shows that this map is log-étale WHY?

#### 1.1.4 Prismatic Cohomology

Let K be either discretely valued or algebraically closed. Let X be a formal smooth  $\mathcal{O}_K$ -scheme equipped with a relative normal crossings divisor D. Write  $X_D$  for log structure induced by D. We will denote by  $X_{D,K}$  the associated log adic space giving by analytification.

The prismatic cohomology of  $X_D$  is the complex of A-modules  $R\Gamma_{\triangle}(X_D/A)$  equipped with a  $\varphi$ -semi-linear map  $\varphi$ . The mod p cohomology is given by setting,

$$\overline{R\Gamma_{\wedge}(X_D/A)} = R\Gamma_{\wedge}(X_D/A) \otimes_A^{\mathbb{L}} A/pA$$

and we will denote by  $\overline{H^i_{\mathbb{A}}(X_D/A)}$  the cohomology of  $\overline{R\Gamma_{\mathbb{A}}(X_D/A)}$ . Then we have the following properties:

(a) There is a canonical isomorphism of commutative algebras in D(A)

$$R\Gamma(\Omega_{X_k/k}^{\bullet}(\log D_k)) \cong \overline{R\Gamma_{\Lambda}(X_D/A)} \otimes_{A/pA,\varphi}^{\mathbb{L}} l$$

(b) If K is algebraically closed then there is an isomorphism of commutative algebras in D(A)

$$R\Gamma_{\operatorname{\acute{e}t}}(X_{D,K},\mathbb{F}_p) \cong \overline{R\Gamma_{\mathbb{A}}(X_D/A)}[1/\xi]^{\varphi=1}$$

(c) the linear map,

$$\varphi^* \overline{R\Gamma_{\wedge}(X_D/A)} \to \overline{R\Gamma_{\wedge}(X_D/A)}$$

becomes an isomorphism in D(A) after inverting u (resp  $\xi$ ) if K i discrete (resp. algebraically closed). For each  $i \geq 0$ , there is a canonical map,

$$V_i: \overline{H^i_{\mathbb{A}}(X_D/A)} \to H^i(\varphi^* \overline{R\Gamma_{\mathbb{A}}(X_D/A)})$$

(d) Let K' be a field complete with respect to a p-adic valuation, and which is either discrete or algebraically closed. Let  $B \to \mathcal{O}_{K'}$  be the corresponding prism, as defined above. Suppose  $K \to K'$  is a map of valued field and  $A \to B$  is compatible with the projection to  $\mathcal{O}_K \to \mathcal{O}_{K'}$  and Frobenius. Then there is a canonical isomorphism

$$\overline{R\Gamma_{\mathbb{A}}(X_D/A)} \otimes_A^{\mathbb{L}} B \cong \overline{R\Gamma_{\mathbb{A}}(X_{D,\mathcal{O}_{K'}}/B)}$$

- (e) When X is proper over  $\mathcal{O}_K$  then  $\overline{R\Gamma_{\Lambda}(X_D/A)}$  is a perfect complex of A/p-modules.
- (f) Suppose that K is algebraically closed, and that X is proper over  $\mathcal{O}_K$  then for each  $i \geq 0$  there are natural isomorphisms

$$H^i_{\mathrm{\acute{e}t}}(X_{D,K},\mathbb{F}_p)\otimes_{\mathbb{F}_p}A/pA[1/\xi]\cong\overline{H^i_{\mathbb{A}}(X_D/A)}[1/\xi]$$

### 1.2 Main Result

Let k be a perfect field of characteristic p. Here we can take K to be a complete p-adic field with discrete valuation such that  $\mathcal{O}_K = W(k)$ .

**Proposition 1.2.1.** Let X be a proper smooth scheme over  $\mathcal{O}_K$  equipped with a relative normal crossings divisor  $D \subset X$ . Set  $U = X \setminus D$  and  $W \subset U_C$  be a dense open subscheme. If  $0 \le i < p-2$  then,

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(U_C, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W, \mathbb{F}_p) \right) \ge h^{0,i}_{(X_C, D_C)}$$

Let's see how this implies the theorem. Let Y be a proper smooth scheme over  $\mathbb{C}$  and  $D \subset Y$  a normal crossings divisor. We say that (Y, D) has good reduction at p if there exists an algebraically closed field  $C \hookrightarrow \mathbb{C}$  over which (Y, D) is defined and a p-adic valuation on C with ring of integers  $\mathcal{O}_C$  and an extension to a smooth proper  $\mathcal{O}_C$ -scheme  $Y^{\circ}$  with a relative normal crossings divisor  $D^{\circ} \subset Y^{\circ}$  over  $\mathcal{O}_C$  extending D. We say that (Y, D) has unramified good reduction at p if in addition  $(Y^{\circ}, D^{\circ})$  can be chosen so that it descends to an absolutely unramified dvr  $\mathcal{O} \subset \mathcal{O}_C$ .

Remark. This condition is actually easily checkable. Indeed if Y is a smooth proper finite type  $\mathbb{C}$ -scheme then it spreads out to a smooth proper scheme  $\mathcal{Y} \to \operatorname{Spec}(A)$  over some finite type  $\mathbb{Z}$ -algebra  $A \subset \mathbb{C}$ . Now suppose there exists  $\mathfrak{p} \subset A$  such that  $\operatorname{Spec}(A) \to \operatorname{Spec}(\mathbb{Z})$  is smooth at  $\mathfrak{p}$  and  $\mathfrak{p} \mapsto (p)$ . This is nothing more than saying that p is not contained in the Jacobian ideal. Then choose a minimal prime  $\xi$  over pA since  $\xi \leadsto \mathfrak{p}$  we see that  $\operatorname{Spec}(A) \to \operatorname{Spec}(\mathbb{Z})$  is smooth at  $\xi$  and hence  $A_{\xi} \subset \mathbb{C}$  is a p-adic dvr unramified over  $\mathbb{Z}_{(p)}$  by smoothness. Then we extend this p-adic valuation to  $\mathbb{C}$  and  $\mathcal{O} = A_{\xi}$  is our requisite unramified dvr.

Corollary 1.2.2. Let Y be a proper smooth connected  $\mathbb{C}$ -scheme and  $D \subset Y$  a normal crossing divisor and  $W \subset U := Y \setminus D$  a dense open subscheme. Suppose that (Y, D) has unramified good reduction at p. If  $0 \le i < p-2$  then,

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(U, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W, \mathbb{F}_p) \right) \geq h^{0,i}_{(X,D)}$$

This proves the main theorem if we take  $D = \emptyset$ .

*Proof.* Since the étale cohomology groups do not change upon base change to algebraically closed fields. By assumption, we may assume that (Y, D) is defined over  $\mathcal{O}$  unramified. Then taking the p-adic completion  $C \subset C'$  we get  $\mathcal{O} \subset \mathcal{O}'$  which is unramified and p-adically complete so we reduce to the previous case.

Proof of Proposition 4.4.1. Let  $k_C$  be the residue field of C. We may replace X by it base change to  $W(k_C)$  and assume that C and K have the ame residue field. Denote by  $\widehat{X}$  and  $\widehat{D}$  the formal completions of X and D. Let  $\widehat{W} \subset \widehat{X}$  be the formal open subschem, which is the complement of  $Z_k$ . Note that we have  $\widehat{W}_C \subset W^{\mathrm{ad}}$  so there is a commutative diagram,

<sup>&</sup>lt;sup>1</sup>meaning unramified over  $\mathbb{Z}_{(p)}$ 

$$H^{i}_{\text{\'et}}(X_{D,C}, \mathbb{F}_{p}) \xrightarrow{} H^{i}_{\text{\'et}}(W, \mathbb{F}_{p})$$

$$\downarrow^{\alpha} \qquad \qquad H^{i}_{\text{\'et}}(W^{\text{ad}}, \mathbb{F}_{p})$$

$$\downarrow^{\alpha} \qquad \qquad \downarrow^{\beta} H^{i}(\widehat{X}_{D,C}, \mathbb{F}_{p}) \xrightarrow{\beta} H^{i}_{\text{\'et}}(\widetilde{X}_{C}, \mathbb{F}_{p})$$

We need to show the following facts,

- (a)  $\alpha$  is an isomorphism
- (b)  $\dim_{\mathbb{F}_p} \operatorname{im} \beta \ge h_{(X,D)}^{0,i}$
- (c)  $H^i_{\text{\'et}}(X_{D,C}, \mathbb{F}_p) \cong H^i_{\text{\'et}}(U_C, \mathbb{F}_p)$

#### WHY IS THE FIRST LEMMA 2.2.10

Now we will prove these three facts.

The only hard one:

Let X be a proper, smooth formal scheem over  $\mathcal{O}_K$  equipped with a relative normal crossing divisor  $D \subset X$ . Let,

$$h_{(X,D)}^{0,i} := \dim_K H^0(X_K, \Omega^i_{X_K/K}(\log D))$$

**Proposition 1.2.3.** Let  $W \subset X \setminus D$  be a dense open formal subscheme. Then for  $0 \le i < p-2$ 

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(X_{D,C}, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W_C, \mathbb{F}_p) \ge h^{0,i}_{(X,D)} \right)$$

*Proof.* Take the prism A to be W(k)[[u]] with E(u) = u - p. We obtain a prism  $A_C \to \mathcal{O}_C$ . There is a Frobenius compatible map  $A \to A_C$  sending  $u \mapsto [p]$ . Set,

which is a finitely generated A/pA = k[[u]]-module. There is an isomorphism,

$$\overline{H^i_{\mathbb{A}}(X_D/A)} \otimes^{\mathbb{L}}_A A_C \xrightarrow{\sim} \overline{H^i_{\mathbb{A}}(X_{D,\mathcal{O}_C}/A_C)}$$

and similarly for the open W. Therefore, by PROPERTY there is an isomorphism

$$\overline{H^i_{\mathbb{A}}(X_D/A)} \otimes^{\mathbb{L}}_A A_C \xrightarrow{\sim} \overline{H^i_{\mathbb{A}}(X_{D,\mathcal{O}_C}/A_C)}$$

Then there are maps,

$$\overline{H^{i}_{\underline{\mathbb{A}}}(X_{D}/A)} \otimes^{\mathbb{L}}_{A} A_{C}[1/\xi] \cong H^{i}_{\mathrm{\acute{e}t}}(X_{D,C}, \mathbb{F}_{p}) \otimes_{\mathbb{F}_{p}} A_{C}/pA_{C}[1/\xi] 
\to H^{i}_{\mathrm{\acute{e}t}}(W_{C}, \mathbb{F}_{p}) \otimes_{\mathbb{F}_{p}} A_{C}/pA_{C}[1/\xi] \to \overline{H^{i}_{\underline{\mathbb{A}}}(W/A)} \otimes_{A} A_{C}[1/\xi]$$

the composite is the natural map. Hence,

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(X_{D,C}, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W_C, \mathbb{F}_p) \right) \ge \dim_{k((u))} M_{\triangle}[1/u]$$

By LEMMA  $M_{\triangle}$  is a finitely generated free k[[u]]-module. Hence it suffices to show  $\dim_k M_{\triangle}/uM_{\triangle} \ge h_{(X,D)}^{0,i}$ .

Hence using Lemma 2.2.1 again, we see that  $\overline{H^j_{\mathbb{A}}(X_D/A)}$  is *u*-torsion free for  $0 \leq j \leq i+1$ . Hence there are maps,

$$H^{i}(X_{k}, \Omega^{\bullet}_{X_{k}/k}(\log D_{k})) \cong \overline{H^{i}_{\underline{\mathbb{A}}}(X_{D}/A)} \otimes_{A,\varphi} k \to M_{\underline{\mathbb{A}}} \otimes_{A,\varphi} k$$
$$\to \overline{H^{i}_{\underline{\mathbb{A}}}(W/A)} \otimes_{A,\varphi} k \to H^{i}(W_{k}, \Omega^{\bullet}_{W_{k}/K}(\log D))$$

where the composition is the natural map. This shows that the image has dimension  $\leq \dim_k M_{\mathbb{A}}/uM_{\mathbb{A}}$  and it suffices to how that this dimension is  $\geq h_{(X,D)}^{0,i}$ . Since  $W \subset X$  is dense, the map,

$$H^0(X_k, \Omega^i_{X_k/k}(\log D)) \to H^0(W_k, \Omega^i_{X_k/k})$$

is injective. Hence the image has dimension at leat  $\dim_k H^0(X_k, \Omega^i_{X_k/k}(\log D_k)) \geq h^{0,i}_{(X,D)}$  I THINK THIS WAS AN ERROR IN THE PAPER NEED LOG D where the last inequality follows from the upper semi-continuity of  $h^0$ .

# 2 Talk 1

Our goal will be the following theorem about the topology of algebraic varities.

**Theorem 2.0.1.** et X be a smooth, proper,  $\mathbb{C}$ -variety with unramified good reduction at p. Let i < p-2 and  $W \subset X$  and Zariki open. Then the image of the restriction map,

$$H^i(X, \mathbb{F}_p) \to H^i(W, \mathbb{F}_p)$$

has dimension at least  $h_X^{0,i} := \dim H^0(X, \Omega_X^i)$ .

This statement amounts to showing that certain cohomology classes are not p-divisible.

There is a version with Q-coefficients that follows from Hodge theory.

**Theorem 2.0.2.** Let X be a smooth, proper, complex variety and  $W \subset X$  any Zariki open. Then the image of the restiction map,

$$H^i(X,\mathbb{Q}) \to H^i(W,\mathbb{Q})$$

has dimension at least  $h_X^{0,i} := \dim H^0(X, \Omega_X^i)$ .

*Proof.* The map  $H^i(X,\mathbb{Q}) \to H^i(W,\mathbb{Q})$  is a morphism of mixed hodge structures. Posibly passing to a log resolution  $\pi:\widetilde{X}\to X$  of  $Z=X\backslash W$  we may assume that  $\pi^{-1}(Z)=D$  is an snc divisor (note the birational modification does not change  $h_X^{0,i}$  and the map  $H^i(\widetilde{X},\mathbb{Q})\to H^i(W,\mathbb{Q})$  factors through  $H^i(X,\mathbb{Q})$  so its image is the same). Then there is a commutative diagram,

where the top map is injective and the downward maps are injective. This immediately implies the claim.  $\Box$ 

The real power of our main result is that it works integrally. This has applications to essential dimension to be discussed later.

## 2.1 Main Result

**Proposition 2.1.1.** Let X be a proper smooth scheme over  $\mathcal{O}_K$  equipped with a relative normal crossings divisor  $D \subset X$ . Set  $U = X \setminus D$  and  $W \subset U_C$  be a dense open subscheme. If  $0 \le i < p-2$  then,

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(U_C, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W, \mathbb{F}_p) \right) \ge h^{0,i}_{(X_C, D_C)}$$

Let's see how this implies the theorem. Let Y be a proper smooth scheme over  $\mathbb{C}$  and  $D \subset Y$  a normal crossings divisor. We say that (Y, D) has good reduction at p if there exists an algebraically closed field  $C \hookrightarrow \mathbb{C}$  over which (Y, D) is defined and a p-adic valuation on C with ring of integers  $\mathcal{O}_C$  and an extension to a smooth proper  $\mathcal{O}_C$ -scheme  $Y^{\circ}$  with a relative normal crossings divisor  $D^{\circ} \subset Y^{\circ}$  over  $\mathcal{O}_C$  extending D. We say that (Y, D) has unramified good reduction at p if in addition  $(Y^{\circ}, D^{\circ})$  can be chosen so that it descends to an absolutely unramified dvr  $\mathcal{O} \subset \mathcal{O}_C$ .

Remark. This condition is actually easily checkable. Indeed if Y is a smooth proper finite type  $\mathbb{C}$ -scheme then it spreads out to a smooth proper scheme  $\mathcal{Y} \to \operatorname{Spec}(A)$  over some finite type  $\mathbb{Z}$ -algebra  $A \subset \mathbb{C}$ . Now suppose there exists  $\mathfrak{p} \subset A$  such that  $\operatorname{Spec}(A) \to \operatorname{Spec}(\mathbb{Z})$  is smooth at  $\mathfrak{p}$  and  $\mathfrak{p} \mapsto (p)$ . This is nothing more than saying that p is not contained in the Jacobian ideal. Then choose a minimal prime  $\xi$  over pA since  $\xi \leadsto \mathfrak{p}$  we see that  $\operatorname{Spec}(A) \to \operatorname{Spec}(\mathbb{Z})$  is smooth at  $\xi$  and hence  $A_{\xi} \subset \mathbb{C}$  is a p-adic dvr unramified over  $\mathbb{Z}_{(p)}$  by smoothness. Then we extend this p-adic valuation to  $\mathbb{C}$  and  $\mathcal{O} = A_{\xi}$  is our requisite unramified dvr.

Corollary 2.1.2. Let Y be a proper smooth connected  $\mathbb{C}$ -scheme and  $D \subset Y$  a normal crossing divisor and  $W \subset U := Y \setminus D$  a dense open subscheme. Suppose that (Y, D) has unramified good reduction at p. If  $0 \le i < p-2$  then,

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(U, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W, \mathbb{F}_p) \right) \geq h^{0,i}_{(X,D)}$$

This proves the main theorem if we take  $D = \emptyset$ .

*Proof.* Since the étale cohomology groups do not change upon base change to algebraically closed fields. By assumption, we may assume that (Y, D) is defined over  $\mathcal{O}$  unramified. Then taking the p-adic completion  $C \subset C'$  we get  $\mathcal{O} \subset \mathcal{O}'$  which is unramified and p-adically complete so we reduce to the previous case.

Proof of Proposition 4.4.1. We just need something that lives between  $H^i_{\text{\'et}}(-,\mathbb{F}_p)$  and  $H^i_{\text{dR}}$ .

Proof of Proposition 4.4.1. Let  $k_C$  be the residue field of C. We may replace X by it base change to  $W(k_C)$  and assume that C and K have the ame residue field. Denote by  $\widehat{X}$  and  $\widehat{D}$  the formal completions of X and D. Let  $\widehat{W} \subset \widehat{X}$  be the formal open subschem, which is the complement of  $Z_k$ . Note that we have  $\widehat{W}_C \subset W^{\mathrm{ad}}$  so there is a commutative diagram,

$$H^{i}_{\text{\'et}}(X_{D,C}, \mathbb{F}_{p}) \xrightarrow{} H^{i}_{\text{\'et}}(W, \mathbb{F}_{p})$$

$$\downarrow^{\alpha} \qquad \qquad H^{i}_{\text{\'et}}(W^{\text{ad}}, \mathbb{F}_{p})$$

$$\downarrow^{\alpha} \qquad \qquad \downarrow^{\beta}$$

$$\downarrow^{\beta} H^{i}(\widehat{X}_{D,C}, \mathbb{F}_{p}) \xrightarrow{\beta} H^{i}_{\text{\'et}}(\widetilde{X}_{C}, \mathbb{F}_{p})$$

<sup>&</sup>lt;sup>2</sup>meaning unramified over  $\mathbb{Z}_{(p)}$ 

We need to show the following facts,

- (a)  $\alpha$  is an isomorphism
- (b)  $\dim_{\mathbb{F}_p} \operatorname{im} \beta \geq h_{(X,D)}^{0,i}$
- (c)  $H^i_{\text{\'et}}(X_{D,C}, \mathbb{F}_p) \cong H^i_{\text{\'et}}(U_C, \mathbb{F}_p)$

#### WHY IS THE FIRST LEMMA 2.2.10

Now we will prove these three facts.

The only hard one:

Let X be a proper, smooth formal scheme over  $\mathcal{O}_K$  equipped with a relative normal crossing divisor  $D \subset X$ . Let,

$$h_{(X,D)}^{0,i}:=\dim_K H^0(X_K,\Omega^i_{X_K/K}(\log D))$$

**Proposition 2.1.3.** Let  $W \subset X \setminus D$  be a dense open formal subscheme. Then for  $0 \le i < p-2$ 

$$\dim_{\mathbb{F}_p} \operatorname{im} (H^i_{\operatorname{\acute{e}t}}(X_{D,C},\mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W_C,\mathbb{F}_p) \ge h^{0,i}_{(X,D)}$$

*Proof.* Take the prism A to be W(k)[[u]] with E(u) = u - p. We obtain a prism  $A_C \to \mathcal{O}_C$ . There is a Frobenius compatible map  $A \to A_C$  sending  $u \mapsto [p]$ . Set,

$$M_{\mathbb{A}} = \operatorname{im}\left(\overline{H^i_{\mathbb{A}}(X_D/A)} \to \overline{H^i_{\mathbb{A}}(W/A)}\right)$$

which is a finitely generated A/pA = k[[u]]-module. There is an isomorphism,

$$\overline{H^i_{\mathbb{A}}(X_D/A)} \otimes^{\mathbb{L}}_A A_C \xrightarrow{\sim} \overline{H^i_{\mathbb{A}}(X_{D,\mathcal{O}_C}/A_C)}$$

and similarly for the open W. Therefore, by PROPERTY there is an isomorphism

$$\overline{H^i_{\mathbb{A}}(X_D/A)} \otimes^{\mathbb{L}}_{A} A_C \xrightarrow{\sim} \overline{H^i_{\mathbb{A}}(X_{D,\mathcal{O}_C}/A_C)}$$

Then there are maps,

$$\overline{H^{i}_{\underline{\mathbb{A}}}(X_{D}/A)} \otimes^{\mathbb{L}}_{A} A_{C}[1/\xi] \cong H^{i}_{\text{\'et}}(X_{D,C}, \mathbb{F}_{p}) \otimes_{\mathbb{F}_{p}} A_{C}/pA_{C}[1/\xi] 
\to H^{i}_{\text{\'et}}(W_{C}, \mathbb{F}_{p}) \otimes_{\mathbb{F}_{p}} A_{C}/pA_{C}[1/\xi] \to \overline{H^{i}_{\underline{\mathbb{A}}}(W/A)} \otimes_{A} A_{C}[1/\xi]$$

the composite is the natural map. Hence,

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(X_{D,C},\mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W_C,\mathbb{F}_p) \right) \geq \dim_{k((u))} M_{\triangle}[1/u]$$

By LEMMA  $M_{\triangle}$  is a finitely generated free k[[u]]-module. Hence it suffices to show  $\dim_k M_{\triangle}/uM_{\triangle} \ge h_{(X,D)}^{0,i}$ .

Hence using Lemma 2.2.1 again, we see that  $\overline{H^j_{\mathbb{A}}(X_D/A)}$  is *u*-torsion free for  $0 \leq j \leq i+1$ . Hence there are maps,

$$H^{i}(X_{k}, \Omega^{\bullet}_{X_{k}/k}(\log D_{k})) \cong \overline{H^{i}_{\underline{\mathbb{A}}}(X_{D}/A)} \otimes_{A,\varphi} k \to M_{\underline{\mathbb{A}}} \otimes_{A,\varphi} k$$
$$\to \overline{H^{i}_{\underline{\mathbb{A}}}(W/A)} \otimes_{A,\varphi} k \to H^{i}(W_{k}, \Omega^{\bullet}_{W_{k}/K}(\log D))$$

where the composition is the natural map. This shows that the image has dimension  $\leq \dim_k M_{\triangle}/uM_{\triangle}$  and it suffices to how that this dimension is  $\geq h_{(X,D)}^{0,i}$ . Since  $W \subset X$  is dense, the map,

$$H^0(X_k, \Omega^i_{X_k/k}(\log D)) \to H^0(W_k, \Omega^i_{X_k/k})$$

is injective. Hence the image has dimension at leat  $\dim_k H^0(X_k, \Omega^i_{X_k/k}(\log D_k)) \geq h^{0,i}_{(X,D)}$  I THINK THIS WAS AN ERROR IN THE PAPER NEED LOG D where the last inequality follows from the upper semi-continuity of  $h^0$ .

## 2.2 Prismatic Cohomology

#### 2.2.1 Prisms

Let K be a field of characteristic 0. By a p-adic valuation on K we mean a rank one valuation  $\nu$  on K, with  $\nu(p) > 0$ . We suppose that K is complete with respect to  $\nu$  with ring of integers  $\mathcal{O}_K$  and perfect residue field k. We will only recall exactly as much about prismatic cohomology as necessary.

**Definition 2.2.1.** A  $\delta$ -ring is a pair  $(R, \delta)$  where R is a commutative ring and  $\delta : R \to R$  is a set map such that,

- (a)  $\delta(0) = \delta(1) = 0$
- (b)  $\delta(xy) = x^p \delta(y) + y^p \delta(x) + p \delta(x) \delta(y)$
- (c)  $\delta(x+y) = \delta(x) + \delta(y) + \frac{x^p + y^p (x+y)^p}{p}$

Note that the last term exists as some universal polynomial with integer coefficients.

We think of this as a sort of "derivation along the *p*-direction". It is also related to lifting Frobenius on R/p. Indeed, if  $\phi(x) = x^p + p\delta(x)$  then  $\phi: R \to R$  is a ring map by property (c) and obviously it lifts  $x \mapsto x^p$  on R/p. In fact, if R is p-torsionfree then lifts of Frobenius are exactly the same as  $\delta$ -ring structures.

**Definition 2.2.2.** Let (A, I) be a pair where A is a  $\delta$ -ring and  $I \subset A$  is an ideal. The pair is a *prism* if

- (a)  $I \subset A$  is invertible (defines a Cartier divisor on Spec (A))
- (b) A is derived (p, I)-complete
- (c)  $p \in I + \phi(I)A$

**Example 2.2.3.** Let A be a p-torsionfree and p-complete  $\delta$ -ring then (A,(p)) is a prism.

**Example 2.2.4.** The *Breuil-Kisin* prism. Assume that  $\nu$  on K is discrete. Set A = W(k)[[u]] equipped with Frobenius  $\varphi$  extending Frobenius on W(k) by  $u \mapsto u^p$ . Equip A with the map  $A \to \mathcal{O}_K$  sending  $u \mapsto \pi$  some uniformizer. It kernel is generated by an Eisenstein polynomial  $E(u) \in W(k)[u]$  for  $\pi$ . In fact, in applications we will assume  $\mathcal{O}_K = W(k)$  and  $\pi = p$ . Then (A, E(u)A) is the Breuil-Kisin prism.

**Example 2.2.5.** Suppose that K is algebraically closed. Let  $R = \varprojlim \mathcal{O}_K/p$  taking the limit over Frobenius. We take A = W(R). Any element  $(x_0, x_1, \dots) \in R$  lifts uniquely to a sequence  $(\hat{x}_0, \hat{x}_1, \dots, ) \in \mathcal{O}_K$  with  $\hat{x}_i^p = \hat{x}_{i-1}$ . Then there is a natural surjective map of rings  $\theta : A \to \mathcal{O}_K$  sending a Teichmuller element x as above to  $\hat{x}_0$ . The kernel of  $\theta$  is principal, generated by  $\xi = p - [\underline{p}]$  where  $p = (p, p^{1/p}, \dots)$  then  $(A, \xi A)$  is an example of a perfect prism.

#### 2.2.2 Logarithmic Cohomology

We will use logarithmic formal schemes over  $\mathcal{O}_K$ . We will consider logarithmic étale cohomology meaning the natural cohomology on the site of log étale covers of logarithmic schemes. The main fact we will use is the following comparison result:

**Theorem 2.2.6.** Let k be an algebraically closed field and X a smooth k-scheme. Let  $D \subset X$  be an snc divisor and  $X_D^{\log}$  the log structure induced by D. Then there is a canonical isomorphism,

$$H^i_{\text{\'et}}(X_D^{\log}, \mu) \xrightarrow{\sim} H^i(X \setminus D, \mu)$$

#### COEFFICIENTS

Proof. Idea: show that any finite étale map  $Y \to X \setminus D$  extends canonically to a finite log-étale map  $\overline{Y} \to X_D$  which proves the statment for i = 1 then use dimension shifting and some spectral sequence. To show the claim, take the normalization of Y in X which gives a finite map  $Y \to X$  ramified only over D by Zariski nagata purity. Then a local check shows that this map is log-étale WHY?

#### 2.2.3 Prismatic Cohomology

Let K be either discretely valued or algebraically closed. Let X be a formal smooth  $\mathcal{O}_K$ -scheme equipped with a relative normal crossings divisor D. Write  $X_D$  for log structure induced by D. We will denote by  $X_{D,K}$  the associated log adic space giving by analytification.

The prismatic cohomology of  $X_D$  is the complex of A-modules  $R\Gamma_{\triangle}(X_D/A)$  equipped with a  $\varphi$ -semi-linear map  $\varphi$ . The mod p cohomology is given by setting,

$$\overline{R\Gamma_{\wedge}(X_D/A)} = R\Gamma_{\wedge}(X_D/A) \otimes_A^{\mathbb{L}} A/pA$$

and we will denote by  $\overline{H^i_{\mathbb{A}}(X_D/A)}$  the cohomology of  $\overline{R\Gamma_{\mathbb{A}}(X_D/A)}$ . Then we have the following properties:

(a) There is a canonical isomorphism of commutative algebras in D(A)

$$R\Gamma(\Omega^{\bullet}_{X_k/k}(\log D_k)) \cong \overline{R\Gamma_{\underline{\mathbb{A}}}(X_D/A)} \otimes^{\mathbb{L}}_{A/pA,\varphi} l$$

(b) If K is algebraically closed then there is an isomorphism of commutative algebras in D(A)

$$R\Gamma_{\operatorname{\acute{e}t}}(X_{D,K},\mathbb{F}_p) \cong \overline{R\Gamma_{\mathbb{A}}(X_D/A)}[1/\xi]^{\varphi=1}$$

(c) the linear map,

$$\varphi^* \overline{R\Gamma_{\wedge}(X_D/A)} \to \overline{R\Gamma_{\wedge}(X_D/A)}$$

becomes an isomorphism in D(A) after inverting u (resp  $\xi$ ) if K i discrete (resp. algebraically closed). For each  $i \geq 0$ , there is a canonical map,

$$V_i: \overline{H^i_{\mathbb{A}}(X_D/A)} \to H^i(\varphi^* \overline{R\Gamma_{\mathbb{A}}(X_D/A)})$$

(d) Let K' be a field complete with respect to a p-adic valuation, and which is either discrete or algebraically closed. Let  $B \to \mathcal{O}_{K'}$  be the corresponding prism, as defined above. Suppose  $K \to K'$  is a map of valued field and  $A \to B$  is compatible with the projection to  $\mathcal{O}_K \to \mathcal{O}_{K'}$  and Frobenius. Then there is a canonical isomorphism

$$\overline{R\Gamma_{\mathbb{A}}(X_D/A)} \otimes_A^{\mathbb{L}} B \cong \overline{R\Gamma_{\mathbb{A}}(X_{D,\mathcal{O}_{K'}}/B)}$$

- (e) When X is proper over  $\mathcal{O}_K$  then  $\overline{R\Gamma_{\mathbb{A}}(X_D/A)}$  is a perfect complex of A/p-modules.
- (f) Suppose that K is algebraically closed, and that X is proper over  $\mathcal{O}_K$  then for each  $i \geq 0$  there are natural isomorphisms

$$H^i_{\mathrm{\acute{e}t}}(X_{D,K},\mathbb{F}_p)\otimes_{\mathbb{F}_p}A/pA[1/\xi]\cong\overline{H^i_{\mathbb{A}}(X_D/A)}[1/\xi]$$

## 2.3 Proof For Real

Proof of Proposition 4.4.1. Let  $k_C$  be the residue field of C. We may replace X by it base change to  $W(k_C)$  and assume that C and K have the ame residue field. Denote by  $\widehat{X}$  and  $\widehat{D}$  the formal completions of X and D. Let  $\widehat{W} \subset \widehat{X}$  be the formal open subschem, which is the complement of  $Z_k$ . Note that we have  $\widehat{W}_C \subset W^{\mathrm{ad}}$  so there is a commutative diagram,

$$H^{i}_{\text{\'et}}(X_{D,C}, \mathbb{F}_{p}) \xrightarrow{H^{i}_{\text{\'et}}(W, \mathbb{F}_{p})} \downarrow \\ \downarrow^{\alpha} \qquad \qquad H^{i}_{\text{\'et}}(W^{\text{ad}}, \mathbb{F}_{p}) \\ \downarrow^{\alpha} \qquad \qquad \downarrow^{H^{i}(\widehat{X}_{D,C}, \mathbb{F}_{p})} \xrightarrow{\beta} H^{i}_{\text{\'et}}(\widetilde{X}_{C}, \mathbb{F}_{p})$$

We need to show the following facts,

- (a)  $\alpha$  is an isomorphism
- (b)  $\dim_{\mathbb{F}_p} \operatorname{im} \beta \geq h_{(X,D)}^{0,i}$
- (c)  $H^i_{\text{\'et}}(X_{D,C}, \mathbb{F}_p) \cong H^i_{\text{\'et}}(U_C, \mathbb{F}_p)$

#### WHY IS THE FIRST LEMMA 2.2.10

Now we will prove these three facts.

The only hard one:

Let X be a proper, smooth formal scheem over  $\mathcal{O}_K$  equipped with a relative normal crossing divisor  $D \subset X$ . Let,

$$h_{(X,D)}^{0,i} := \dim_K H^0(X_K, \Omega^i_{X_K/K}(\log D))$$

**Proposition 2.3.1.** Let  $W \subset X \setminus D$  be a dense open formal subscheme. Then for  $0 \le i < p-2$ 

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(X_{D,C}, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W_C, \mathbb{F}_p) \ge h^{0,i}_{(X,D)} \right)$$

*Proof.* Take the prism A to be W(k)[[u]] with E(u) = u - p. We obtain a prism  $A_C \to \mathcal{O}_C$ . There is a Frobenius compatible map  $A \to A_C$  sending  $u \mapsto [p]$ . Set,

$$M_{ \text{\Large \& }} = \operatorname{im} \, (\overline{H^i_{ \text{\Large \& }}(X_D/A)} \to \overline{H^i_{ \text{\Large \& }}(W/A)})$$

which is a finitely generated A/pA = k[[u]]-module. There is an isomorphism,

$$\overline{H^i_{\mathbb{A}}(X_D/A)} \otimes^{\mathbb{L}}_A A_C \xrightarrow{\sim} \overline{H^i_{\mathbb{A}}(X_{D,\mathcal{O}_C}/A_C)}$$

and similarly for the open W. Therefore, by PROPERTY there is an isomorphism

$$\overline{H^i_{\bigwedge}(X_D/A)} \otimes^{\mathbb{L}}_A A_C \xrightarrow{\sim} \overline{H^i_{\bigwedge}(X_{D,\mathcal{O}_C}/A_C)}$$

Then there are maps,

$$\overline{H^{i}_{\mathbb{A}}(X_{D}/A)} \otimes^{\mathbb{L}}_{A} A_{C}[1/\xi] \cong H^{i}_{\text{\'et}}(X_{D,C}, \mathbb{F}_{p}) \otimes_{\mathbb{F}_{p}} A_{C}/pA_{C}[1/\xi] 
\to H^{i}_{\text{\'et}}(W_{C}, \mathbb{F}_{p}) \otimes_{\mathbb{F}_{p}} A_{C}/pA_{C}[1/\xi] \to \overline{H^{i}_{\mathbb{A}}(W/A)} \otimes_{A} A_{C}[1/\xi]$$

the composite is the natural map. Hence,

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(X_{D,C}, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W_C, \mathbb{F}_p) \right) \ge \dim_{k((u))} M_{\wedge}[1/u]$$

By LEMMA  $M_{\mathbb{A}}$  is a finitely generated free k[[u]]-module. Hence it suffices to show  $\dim_k M_{\mathbb{A}}/uM_{\mathbb{A}} \ge h_{(X,D)}^{0,i}$ .

Hence using Lemma 2.2.1 again, we see that  $\overline{H^j_{\mathbb{A}}(X_D/A)}$  is *u*-torsion free for  $0 \leq j \leq i+1$ . Hence there are maps,

$$H^{i}(X_{k}, \Omega^{\bullet}_{X_{k}/k}(\log D_{k})) \cong \overline{H^{i}_{\underline{\mathbb{A}}}(X_{D}/A)} \otimes_{A,\varphi} k \to M_{\underline{\mathbb{A}}} \otimes_{A,\varphi} k$$
$$\to \overline{H^{i}_{\underline{\mathbb{A}}}(W/A)} \otimes_{A,\varphi} k \to H^{i}(W_{k}, \Omega^{\bullet}_{W_{k}/K}(\log D))$$

where the composition is the natural map. This shows that the image has dimension  $\leq \dim_k M_{\triangle}/uM_{\triangle}$  and it suffices to how that this dimension is  $\geq h_{(X,D)}^{0,i}$ . Since  $W \subset X$  is dense, the map,

$$H^0(X_k, \Omega^i_{X_k/k}(\log D)) \to H^0(W_k, \Omega^i_{X_k/k})$$

is injective. Hence the image has dimension at leat  $\dim_k H^0(X_k, \Omega^i_{X_k/k}(\log D_k)) \geq h^{0,i}_{(X,D)}$  I THINK THIS WAS AN ERROR IN THE PAPER NEED LOG D where the last inequality follows from the upper semi-continuity of  $h^0$ .

Therefore we conclude using the following lemma:

**Lemma 2.3.2.** Suppose that (X, D) admits a lift to  $W_2(k)$  called  $(\widetilde{X}, \widetilde{D})$  with  $\widetilde{D}$  a snc divisor flat over  $W_2(k)$ . Then for j < p,

$$H^0(X^1, \Omega^j_{X^1/k}(\log D^1)) \hookrightarrow H^j(X, \Omega^{\bullet}_{X/k}(\log D))$$

is canonically a direct summand.

*Proof.* This follows from the existence of the Cartier operator in the same way as in Deligne-Illusie.  $\Box$ 

## 3 Talk 2

#### 3.1 The Prismatic Site

**Lemma 3.1.1.** If  $(A, I) \to (B, J)$  is a map of prismis then the natural map induces an isomorphism  $I \otimes_A B \cong J$ . In particular, IB = J.

Fix a (bounded) prism (A, I) and a formulal smooth A/I-algebra R. The prismatic site of R relative to A, dentoed  $(R/A)_{\triangle}$ , is the category whose objects are prisims (B, IB) over (A, I) together with an A/I-algebra map  $R \to B/IB$ 

$$\begin{array}{ccc}
B & \longrightarrow B/I & \longleftarrow R \\
\uparrow & & \downarrow \\
A & \longrightarrow A/I
\end{array}$$

these are the diagrams. Covers are faithfully flat maps of prisms.

**Definition 3.1.2.** A map  $(A, I) \to (B, IB)$  of prisms is *(faithfully) flat* if  $A/(p, I) \to B \otimes_A^{\mathbb{L}} A/(p, I)$  is *(faithfully) flat*.

**Definition 3.1.3.** The structure sheaf of  $(R/A)_{\wedge}$  is the sheaf,

$$\mathcal{O}_{\mathbb{A}}:(B,IB)\mapsto B$$

Likewise we define a sheaf  $\overline{\mathcal{O}_{\mathbb{A}}}$  on  $(R/A)_{\mathbb{A}}$  defined by,

$$\overline{\mathcal{O}}_{\mathbb{A}}: (B, IB) \mapsto B/IB$$

**Definition 3.1.4.**  $\mathbb{A}_{R/A} := R\Gamma_{\mathbb{A}}(X/A) := R\Gamma_{\mathbb{A}}((R/A)_{\mathbb{A}}, \mathcal{O}_{\mathbb{A}})$ 

#### 3.1.1 The non-affine case

**Definition 3.1.5.** Let (A, I) be a bounded prism and  $X \to \operatorname{Spec}(A/I)$  be a scheme. Then the *prismatic site* of X relative to A, denoted  $(X/A)_{\mathbb{A}}$ , is the category of objects,

We endow  $(X/A)_{\triangle}$  by the Grothendieck topology given by faithfully flat covers of prisms and there are sheaves,

$$\mathcal{O}_{\mathbb{A}}:(B,IB)\mapsto B$$

and

$$\overline{\mathcal{O}}_{\mathbb{A}}:(B,IB)\mapsto B/I$$

Note that  $\mathcal{O}_{\mathbb{A}}$  is valued in (p, I)-complete A- $\delta$ -algebras while  $\overline{\mathcal{O}}_{\mathbb{A}}$  is valued in p-complete R-algebras.

# 3.2 Breuil-Kisin and Breuil-Kisin-Fargues Prisms

As pointed out last time, to make the étale comparison theorem work we need an algebraically closed field but we want to work over K = Frac(W(k)) to set up our Breuil-Kisin prism but this is not algebraically closed. Therefore, we will need to work with two different prisms and a comparison between them.

#### 3.2.1 Breuil-Kisin Prism

Recall our construction. Let k be a perfect field of characteristic p and  $K = \operatorname{Frac}(W(k))$  which is a complete p-adic field with  $\mathcal{O}_K = W(k)$ . You should think of the example  $k = \mathbb{F}_p$  and  $K = \mathbb{Q}_p$  but we might need k to be the perfection of the function field of a variety over  $\mathbb{F}_p$  as we discussed last time. Then we define.

**Definition 3.2.1.** The Breuil-Kisin prism for K is A = W(k)[[u]] with I = (u - p) = (E(u)) so we get a map  $A \to A/I = W(k) = \mathcal{O}_K$ .

#### 3.2.2 Breuil-Kisin-Fargues Prism

Let C be an algebraically closed complete p-adic field (we will later take C to be the completion of the algebraic closure of K). Then we set,

$$R = \varprojlim_{x \mapsto x^p} \mathcal{O}_K / p$$

**Definition 3.2.2.** The *Breuil-Kisin-Fargues prism* is B = W(R) with its canonical Frobenius. Note there is an isomorphism of commutative monoids:

$$\lim_{x \to x^p} \mathcal{O}_K \to \lim_{x \to x^p} \mathcal{O}_K / p$$

$$x \mapsto [x]$$

There is a surjective map of rings

$$\theta: B \to \mathcal{O}_C$$

which sends

$$[x] \mapsto x \mapsto x_0$$

Then  $\ker \theta$  is generated by

$$\xi := p - [p]$$

where  $p = (p, p^{1/p}, ...)$ . Then  $(B, \xi B)$  is a perfect prism.

We will always work with A = W(k)[[u]] the Breuil-Kisin prism for a scheme over  $\mathcal{O}_K = W(k)$  and the Breuil-Kisin-Fargues prism B for a scheme over  $\mathcal{O}_C$ .

Let  $K \to C$  be a map of p-adic fields with K and C as above. Then there is a comparison map,

$$\begin{array}{ccc}
A & \longrightarrow & B \\
\downarrow & & \downarrow \\
\mathcal{O}_K & \longrightarrow & \mathcal{O}_C
\end{array}$$

where the map  $A \to B$  is given by  $u \mapsto [\underline{p}]$  and therefore  $E(u) = u - p \mapsto -\xi$ .

It will be useful to record the following fact:

$$k[[u]] = A/pA \rightarrow B/pB$$

is flat. Since k[[u]] is a DVR this amounts to showing that  $u \mapsto [\underline{p}] \in B/pB = R$  is a non-zerodivisor. Since [p] lists along the monoid map to p which is nonzero this is clear because  $\mathcal{O}_C$  is a domain.

## 3.3 Comparison Results

We need the following comparison theorems.

#### 3.3.1 de Rham Comparison

Let k be the residue field of  $\mathcal{O}_K$ . Let  $X \to \operatorname{Spec}(\mathcal{O}_K)$  be a smooth scheme. Then for any bounded prism (A, I) (we will always take the Breuil-Kisin prism) with  $A/I \xrightarrow{\sim} \mathcal{O}_K$  there are canonical isomorphisms,

$$R\Gamma(X,\Omega_X^{\bullet}) \stackrel{\sim}{\longrightarrow} R\Gamma_{\wedge}(X/A) \hat{\otimes}_{A,\phi_A}^{\mathbb{L}} \mathcal{O}_K$$

and therefore canonical isomorphisms,

$$R\Gamma(X_k, \Omega_{X_k}^{\bullet}) \xrightarrow{\sim} R\Gamma_{\Lambda}(X/A) \otimes_{A,\varphi}^{\mathbb{L}} k \xrightarrow{\sim} \overline{R\Gamma_{\Lambda}(X/A)} \otimes_{A/pA,\varphi}^{\mathbb{L}} k$$

#### 3.3.2 étale Comparison

Let  $(B, \xi B)$  be a perfect prism and  $B/I \xrightarrow{\sim} \mathcal{O}_C$  for C an algebraically closed p-adically complete field (we will always take  $(B, \xi B)$  to be the Breuil-Kisin-Fargues prisim associated to C). Let  $X \to \operatorname{Spec}(\mathcal{O}_C)$  be a smooth scheme. Then there are canonical isomorphisms,

$$R\Gamma_{\operatorname{\acute{e}t}}(X_C,\mathbb{F}_p) \xrightarrow{\sim} \overline{R\Gamma_{\wedge}(X/B)}[1/\xi]^{\varphi=1}$$

where  $\varphi = 1$  means taking the fiber of the semilinear endomorphism  $\varphi - 1$ .

Lemma 3.3.1. This comparison theorem gives an exact triangle,

$$R\Gamma_{\text{\'et}}(X_C, \mathbb{F}_p) \to R\overline{R\Gamma_{\wedge}(X/B)}[1/\xi] \xrightarrow{1-\varphi} \overline{R\Gamma_{\wedge}(X/B)}[1/\xi] \to +1$$

and hence (because the target is a B/pB-module) morphisms,

$$H^i_{\mathrm{\acute{e}t}}(X_C, \mathbb{F}_p) \otimes_{\mathbb{F}_p} B/pB \to \overline{H^i_{\mathbb{A}}(X/B)}[1/\xi]$$

If  $X \to \operatorname{Spec}(\mathcal{O}_C)$  is proper these are isomorphisms.

#### 3.3.3 Base Change

Because we are working with two different prisms, we need some sort of base change result. Luckily the following very general comparison theorem holds.

**Theorem 3.3.2.** Let  $(A, I) \to (B, J)$  be a map of bounded prisms and  $Y = X \times_{\text{Spec}(A/I)} \text{Spec}(B/J)$ . Then the natural map,

$$R\Gamma_{\wedge}(X/A)\hat{\otimes}_{A}^{\mathbb{L}}B \xrightarrow{\sim} R\Gamma_{\wedge}(Y/B)$$

is an isomorphism.

This implies the following,

$$\overline{R\Gamma_{\triangle}(Y/B)} = (R\Gamma_{\triangle}(X/A)\hat{\otimes}_{A}^{\mathbb{L}}B) \otimes_{B}^{\mathbb{L}} B/pB$$

$$= R\Gamma_{\triangle}(X/A)\hat{\otimes}_{A}^{\mathbb{L}}B/pB$$

$$= R\Gamma_{\triangle}(X/A)\hat{\otimes}_{A}^{\mathbb{L}}(A/pA)\hat{\otimes}_{A/pA}^{\mathbb{L}}B/pB$$

$$= \overline{R\Gamma_{\triangle}(X/A)}\hat{\otimes}_{A/pA}^{\mathbb{L}}B/pB$$

In particular, if  $A/pA \to B/pB$  is flat then we get comparison isomorphisms,

$$\overline{H^i_{\mathbb{A}}(Y/B)} \xrightarrow{\sim} \overline{H^i_{\mathbb{A}}(X/A)} \hat{\otimes}_A B/pB = \overline{H^i_{\mathbb{A}}(X/A)} \hat{\otimes}_A B$$

#### 3.3.4 Finiteness of cohomology

**Theorem 3.3.3.** Let (A, I) be a bounded prism. Let  $X \to \operatorname{Spec}(A/I)$  be a smooth proper scheme. Then  $R\Gamma_{\mathbb{A}}(X/A)$  is a perfect complex of A-modules.

In particular, applying  $-\otimes^{\mathbb{L}} A/pA$  and taking cohomology we see that  $\overline{H^i_{\mathbb{A}}(X/A)}$  is a finite A/pA-module.

#### 3.4 Proof of the Main Theorem

As before let  $K = \operatorname{Frac}(W(k))$  for k a perfect field. Let C be the completion of the algebraic closure.

**Theorem 3.4.1.** Let  $X \to \operatorname{Spec}(\mathcal{O}_K)$  be a smooth proper scheme and  $W \subset X$  an open which is dense in the special fiber. Then for  $0 \le i < p-2$ 

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( H^i_{\operatorname{\acute{e}t}}(X_C, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W_C, \mathbb{F}_p) \right) \geq h^{i,0}_X := \dim_K H^0(X_K, \Omega^i_{X_K})$$

*Proof.* As before, we set A to be the Breuil-Kisin prisim for K and B to be the Breuil-Kisin-Fargues prism for C. Now set,

$$M_{\wedge} := \operatorname{im}\left(\overline{H^i_{\wedge}(X/A)} \to \overline{H^i_{\wedge}(W/A)}\right)$$

Because X is proper the first term is finite and hence  $M_{\triangle}$  is a finite A/pA = k[[u]]-module. By the comparison theorem and the fact that  $A/pA \to B/pB$  is flat,

$$\overline{H^i_{\mathbb{A}}(X/A)} \hat{\otimes}_A B \xrightarrow{\sim} \overline{H^i_{\mathbb{A}}(X_{\mathcal{O}_C}/B)}$$

The proof will then proceed by the following steps.

#### 3.4.1 The étale Comparison Diagram

Consider the diagram,

The top maps are isomorphisms because X is proper (using the lemma after the étale comparison theorem). Furthermore, since B/pB is flat over A/pA the map

$$M_{\wedge} \hat{\otimes}_{k[[u]]} B/pB[1/\xi] \to \overline{H^i_{\wedge}(W/A)} \otimes_A B/pB[1/\xi]$$

is injective. Therefore,

$$\dim_{\mathbb{F}_p} \operatorname{im} \operatorname{res}_W^{\operatorname{\acute{e}t}} \geq \dim_{k((u))} M_{\triangle}[1/u]$$

note that mod p we have  $u \mapsto -\xi$ .

#### 3.4.2 The de Rham Comparison Diagram

Consider the diagram,

The leftmost maps are given by the subs in the Tor-spectral sequence. To show the map,

$$\overline{H^i_{\bigwedge}(X/A)} \otimes_{A,\varphi} k \xrightarrow{\sim} H^i(\overline{R\Gamma_{\bigwedge}(X/A)} \otimes_{A,\varphi}^{\mathbb{L}} k)$$

is an isomorphism we need to prove the following claim:

For 
$$0 \le j \le i+1$$
 the  $A/pA = k[[u]]$ -modules  $\overline{H^i_{\mathbb{A}}(X/A)}$  are u-torsion free.

Given this claim, since  $\operatorname{res}_W^{dR}$  factors through the k-module  $M_{\triangle} \otimes_{A,\varphi} k$  we see that,

$$\dim_k \operatorname{im} \operatorname{res}_W^{dR} \leq \dim_k M_{\wedge} \otimes_{A,\varphi} k = \dim_k M_{\wedge} / u M_{\wedge}$$

#### WHAT ABOUT THE FROB HERE?

Therefore if we can show the next claim:

 $M_{\triangle}$  is a finitely generated free k[[u]]-module.

Then we conclude that,

$$\dim_{\mathbb{F}_p} \operatorname{im} \operatorname{res}_W^{\operatorname{\acute{e}t}} \geq \dim_{k((u))} M_{\triangle}[1/u] = \dim_k M_{\triangle}/u M_{\triangle} \geq \dim_k \operatorname{im} \operatorname{res}_W^{\operatorname{dR}}$$

Therefore it suffices to bound  $\operatorname{res}_W^{\operatorname{dR}}$ .

### 3.4.3 Cartier Isomorphism

Recall that because  $X_k$  is a smooth scheme over a perfect field k which lifts over  $W_2(k)$  there is an isomorphism in the derived category,

$$\bigoplus_{i < p} \Omega^i_{X^{(p)}_k}[-i] \stackrel{\textstyle \sim}{\longrightarrow} \tau_{< p} F_* \Omega^{\bullet}_X$$

in the derived category where  $F: X_k \to X_k^{(p)}$  is the relative Frobenius. This decomposition is natural so we get a commutative diagram,

$$H^{0}(X_{k}^{(p)}, \Omega_{X_{k}^{(p)}}^{i}) \longleftrightarrow H^{0}(W_{k}^{(p)}, \Omega_{W_{k}^{(p)}})$$

$$\downarrow \qquad \qquad \downarrow$$

$$H^{i}(X_{k}, \Omega_{X_{k}}^{\bullet}) \xrightarrow{\operatorname{res}_{W}^{\operatorname{dR}}} H^{i}(W_{k}, \Omega_{W_{k}}^{\bullet})$$

Since the maps along the top are injective we see that,

$$\dim_k \operatorname{imres}_W^{\mathrm{dR}} \ge \dim_k H^0(X_k^{(p)}, \Omega_{X_k^{(p)}}^i) = \dim_k H^0(X_k, \Omega_{X_k}^i)$$

The last equality follows from the  $\varphi$ -semilinear isomorphism of schemes  $X_k \to X_k^{(p)}$ . Finally,

$$\dim_k \operatorname{im} \operatorname{res}_W^{dR} \ge \dim_k H^0(X_k, \Omega_{X_k}^i) \ge \dim_K H^0(X_K, \Omega_{X_K}^i)$$

by upper semicontinuity which completes the proof (modulo the claims).

## 4 Talk 3

**Definition 4.0.1.** Let  $f: Y \to X$  be a finite map of complex algebraic varities. The *essential dimension*  $\operatorname{ed}(Y/X)$  of f is the smallest integer e such that, over some dense open of X, the map f arises as the pullback of a map of varities of dimension e.

**Example 4.0.2.** Note that if  $g: Y \to X$  is a cyclic cover, meaning the extension of fields is Galois with a cyclic Galois group, then because the base field  $\mathbb C$  contains all roots of unity we see that  $g: Y \to X$  is generically the extraction of an  $n^{\text{th}}$ -root of some rational function x on X. Then the map  $Y \to X$  is generically pulled back from  $z^n: \mathbb A^1 \to \mathbb A^1$  hence  $\operatorname{ed}(Y/X) = 1$ .

**Example 4.0.3.** The  $S_n$ -quotient  $f_n : \mathbb{A}^n \to \mathbb{A}^n$  is the example that motivated the development of the study of essential dimension. Note that if the generic degree n polynomial is solvable in radicals then  $f_n$  is a composition of cyclic covers and hence has  $\operatorname{ed}(f_n) = 1$ . For n = 5 we know  $\operatorname{ed}(f_5) = 2$  so given radicals and one other function (determined by the essential dimension covering) we can solve degree 5 polynomials. Working out  $\operatorname{ed}(f_n)$  is a major open problem.

**Definition 4.0.4.** Let  $f: Y \to X$  be a finite map of complex algebraic varities. The *p*-essential dimension  $\operatorname{ed}(Y/X;p)$  of f is the minimum over  $\operatorname{ed}(Y'/X';p)$  of all generically-finite maps  $X' \to X$  of degree coprime to p and  $Y' = Y \times_X X'$ .

**Definition 4.0.5.** Recall that the mod p-homology cover of a space X is the étale cover  $Y \to X$  corresponding to the maximal  $(\mathbb{Z}/p\mathbb{Z})^n$  quotient of  $\pi_1(X)$ .

#### 4.1 Theorems

**Theorem 4.1.1** (A). Let X be a smooth proper complex variety, and  $Y \to X$  its mod p homology cover. Suppose that X has good unramified reduction at p, and let  $b_1$  denote the first betti number of X. Then for  $p > \max\{\frac{1}{2}b, 3\}$ ,

$$\operatorname{ed}(Y/X;p) \ge \min\{\dim X, \frac{1}{2}b_1\}$$

In the following cases, this theorem shows that the mod p homology cover is p-imcompressible meaning  $\operatorname{ed}(Y/X;p)=\dim X$ 

- (a) X is an abelian variety
- (b)  $X = C_1 \times \cdots \times C_r$  for curve of genus  $g(C_i) \geq 1$
- (c) locally symmetric varities associated to cocompact lattices in SU(n,1)

**Theorem 4.1.2** (B). Let X be a smooth, proper complex variety, G a finite group, and  $Y \to X$  a G-cover. Suppose that X has unramified good reduction at p and let  $i . If <math>H^0(X, \Omega_X^i) \neq 0$  and the map  $H^i(G, \mathbb{F}_p) \to H^i(X, \mathbb{F}_p)$  is surjective then

$$\operatorname{ed}(Y/X; p) \ge i$$

Note the map is defined by the map  $\pi_1(X) \to G$  and the natural maps

$$H^i(G, \mathbb{F}_p) \to H^i(\pi_1(X), \mathbb{F}_p) \to H^i(X, \mathbb{F}_p)$$

## 4.2 Abelian Varieties

#### 4.3 Idea

We will use the following theorem

**Theorem 4.3.1** (C). Let X be a smooth, proper, complex variety, with unramified good reduction at p and  $W \subset X$  a Zariski open. Then the following hold

(a) if i then

$$\dim_{\mathbb{F}_p} \operatorname{im} (H^i(X, \mathbb{F}_p) \to H^i(W, \mathbb{F}_p)) \ge h_X^{i,0}$$

- (b) if X is an abelian variety then the above also holds for i=p-2
- (c) if  $p > \max\{i+1,3\}$  and  $i \leq \dim X$  then

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( \wedge^i H^1_{\operatorname{\acute{e}t}}(X, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W, \mathbb{F}_p) \right) \ge \begin{pmatrix} h_X^{1,0} \\ i \end{pmatrix}$$

The proof uses prismatic cohomology. Then we will deduce Theorem B as follows. Consider the composite,

$$H^i(G, \mathbb{F}_p) \to H^i(X, \mathbb{F}_p) \to H^i(W, \mathbb{F}_p)$$

The assumptions ensure that this map is nonzero. However, if  $Y|_W \to W$  arises from a covering of varieties  $Y' \to Z'$  of dimension < i then the map factors as

$$H^i(G, \mathbb{F}_p) \to H^i(Z, \mathbb{F}_p) \to H^i(W, \mathbb{F}_p)$$

By possibily shrinking W and then Z we may assume that Z is affine, and it follows that the above map must vanish since the cohomological dimension of affine varities is at most their dimension.

For theorem A we instead we need a result for  $\wedge^i H^1(X, \mathbb{F}_p) \to H^i(W, \mathbb{F}_p)$ .

## 4.4 Proofs

Let k be a perfect field and  $K = \operatorname{Frac}(W(k))$ .

**Proposition 4.4.1.** Let X be a smooth proper scheme over  $\mathcal{O}_K$  let  $W \subset X$  be a dense open subscheme. If  $0 \le i < p-2$  then

(a) if i < p-2 then

$$\dim_{\mathbb{F}_p} \operatorname{im} (H^i(X, \mathbb{F}_p) \to H^i(W, \mathbb{F}_p)) \ge h_X^{i,0}$$

- (b) if X is an abelian variety then the above also holds for i = p 2
- (c) if  $p > \max\{i+1,3\}$  and  $i \leq \dim X$  then

$$\dim_{\mathbb{F}_p} \operatorname{im} \left( \wedge^i H^1_{\operatorname{\acute{e}t}}(X, \mathbb{F}_p) \to H^i_{\operatorname{\acute{e}t}}(W, \mathbb{F}_p) \right) \geq \binom{h_X^{1,0}}{i}$$

Let's see how this implies the theorem. Let Y be a proper smooth scheme over  $\mathbb{C}$ . We say that Y has good reduction at p if there exists an algebraically closed field  $C \hookrightarrow \mathbb{C}$  over which Y is defined and a p-adic valuation on C with ring of integers  $\mathcal{O}_C$  and an extension to a smooth proper  $\mathcal{O}_C$ -scheme  $Y^{\circ}$  over  $\mathcal{O}_C$ . We say that Y has unramified good reduction at p if in addition  $(Y^{\circ}, D^{\circ})$  can be chosen so that it descends to an absolutely unramified d dvr  $\mathcal{O} \subset \mathcal{O}_C$ .

Remark. This condition is actually easily checkable. Indeed if Y is a smooth proper finite type  $\mathbb{C}$ -scheme then it spreads out to a smooth proper scheme  $\mathcal{Y} \to \operatorname{Spec}(A)$  over some finite type  $\mathbb{Z}$ -algebra  $A \subset \mathbb{C}$ . Now suppose there exists  $\mathfrak{p} \subset A$  such that  $\operatorname{Spec}(A) \to \operatorname{Spec}(\mathbb{Z})$  is smooth at  $\mathfrak{p}$  and  $\mathfrak{p} \mapsto (p)$ . This is nothing more than saying that p is not contained in the Jacobian ideal. Then choose a minimal prime  $\xi$  over pA since  $\xi \leadsto \mathfrak{p}$  we see that  $\operatorname{Spec}(A) \to \operatorname{Spec}(\mathbb{Z})$  is smooth at  $\xi$  and hence  $A_{\xi} \subset \mathbb{C}$  is a p-adic dvr unramified over  $\mathbb{Z}_{(p)}$  by smoothness. Then we extend this p-adic valuation to  $\mathbb{C}$  and  $\mathcal{O} = A_{\xi}$  is our requisite unramified dvr.

Remark. Given a variety over  $\mathbb{C}$ , it has unramified good reduction at all but finitely many primes p because if we spread out to some finite type  $\mathbb{Z}$ -algebra  $A \subset \mathbb{C}$  then  $\operatorname{Spec}(A) \to \operatorname{Spec}(\mathbb{Z})$  is smooth over all but finitely many primes.

DO Corollary 2.2.13 and discussion following and the discussion following 2.2.15 but we.

#### 4.5 Characeristic Classes

Let C be an algebraically closed field of characteristic 0.

Let X be a proper, connected, smooth C-scheme, equipped with a normal crossings divisor D. Fix a geometric point  $\bar{\eta}$  mapping to the generic point  $\eta \in X$ . Let  $\pi_1^{\text{\'et}}(X, \bar{\eta}) \twoheadrightarrow G$  be a finite quotient. For any i there are canoincal maps,

$$H^i(G, \mathbb{F}_p) \to H^i(\pi_1^{\text{\'et}}(X, \bar{\eta}), \mathbb{F}_p) \to H^i_{\text{\'et}}(X, \mathbb{F}_p)$$

where the first map is inflation and the second is induced by the comparison map between the finite étale and étale sites.

**Theorem 4.5.1** (D). Suppose that i < p-2 and X has unramified good reduction at p. Let G be a finite group and  $Y \to X$  a connected G-cover. Suppose that  $h_X^{i,0} \neq 0$  and that the map

$$H^i(G, \mathbb{F}_p) \to H^i_{\text{\'et}}(X, \mathbb{F}_p)$$

is surjective. Then  $\operatorname{ed}(Y/X;p) \geq i$ . If X is an abelian variety the above also holds for i=p-2.

<sup>&</sup>lt;sup>3</sup>meaning unramified over  $\mathbb{Z}_{(p)}$ 

*Proof.* Let  $X' \to X$  be a finite connected covering which has prime to p degree over  $\eta$ , and let  $\eta' \in X'$  be the generic point. We need to show that  $\operatorname{ed}(Y'/X' \ge i)$  where  $Y' = Y \times_X X'$ . Consider the composite

$$H^i(G, \mathbb{F}_p) \to H^i(\pi_1^{\text{\'et}}(X, \bar{\eta}), \mathbb{F}_p) \to H^i_{\text{\'et}}(X, \mathbb{F}_p) \to H^i(\eta, \mathbb{F}_p) \to H^i(\eta', \mathbb{F}_p)$$

Our assumptions imply that the composition of the first two maps is surjective. Since  $h_X^{i,0} \neq 0$  then Theorem B implies that the third map is nonzero. The composite of the fourth map with trace  $H^i(\eta', \mathbb{F}_p) \to H^i(\eta, \mathbb{F}_p)$  is multiplication by  $\deg X'/X$  which is coprime to p and hence invertible. Therefore, the fourth map must be injective so the composite is nonzero.

Suppose  $\operatorname{ed}(Y'/X') < i$ . Then for some dense open  $W \subset X'$  there is a map of C-schemes  $W \to Z$  with  $\dim Z < i$  and a G-cover  $Y'_Z \to Z$  such that  $Y'|_W \cong Y'_Z \times_Z W$  as G-torsors. Shrinking Z and W if necessary, we may assume that Z is affine. The above constructions give a diagram

$$H^{i}(G, \mathbb{F}_{p}) \longrightarrow H^{i}_{\text{\'et}}(Z, \mathbb{F}_{p})$$

$$\downarrow \qquad \qquad \downarrow$$

$$H^{i}(G, \mathbb{F}_{p}) \longrightarrow H^{i}_{\text{\'et}}(W, \mathbb{F}_{p}) \longrightarrow H^{i}_{\text{\'et}}(\eta', \mathbb{F}_{p})$$

Since Z is affine of dimension < i it follows that  $H^i_{\text{\'et}}(Z, \mathbb{F}_p) = 0$ . This implies that the composite of the maps in the bottom from is zero contradicting what we previously demonstrated.

**Corollary 4.5.2.** Let A/C be an abelian variety of dimension g. Let  $p \geq g+2$  and suppose that X has unramified good reduction at p. Then  $[p]: A \to A$  as a  $(\mathbb{Z}/p\mathbb{Z})^{2g}$ -cover has  $\operatorname{ed}([p]; p) = g$ . In particular, this equality holds for almost all p.

*Proof.* By definition  $g = \dim X \ge \operatorname{ed}([p]; p)$  so it suffices to prove that  $\operatorname{ed}([p]; p) \ge g$ . Let  $G = (\mathbb{Z}/p\mathbb{Z})^{2g}$  be the quotient of  $\pi_1^{\text{\'et}}(A, \bar{\eta})$  corresponding to  $[p]: A \to A$ . The map

$$H^i(G, \mathbb{F}_p) \to H^i_{\mathrm{\acute{e}t}}(A, \mathbb{F}_p)$$

is surjective because it is surjective on i=1 and  $H^{\bullet}(A, \mathbb{F}_p)$  is the exterior algebra generated in  $H^1(A, \mathbb{F}_p)$  by cup product. Since  $h^{g,0}=1$  we conclude that  $\operatorname{ed}([p]; p) \geq g$  by the previous theorem.

## 4.6 Mod p homology covers

We now specify our attention to when the G-cover  $Y \to X$  is the mod p homology cover of X. Recall that the mod p homology cover is given by the maximal quotient  $\pi_1^{\text{\'et}}(X) \twoheadrightarrow (\mathbb{Z}/p\mathbb{Z})^{2g}$ . This is the same as the quotient by p of the abelianization of  $\pi_1^{\text{\'et}}(X)$ . Note that this arises as follows,

$$\begin{array}{ccc}
Y & \longrightarrow & \text{Alb}_X \\
\downarrow & & \downarrow \times_p \\
X & \longrightarrow & \text{Alb}_X
\end{array}$$

because  $\pi_1^{\text{\'et}}(X) \to \pi_1^{\text{\'et}}(\mathrm{Alb}_X)$  IS THIS TRUE IF THERE IS TORSION IN  $H^1$ 

**Theorem 4.6.1** (E). Suppose X has unramified good reduction at p. Suppose that  $i \leq \min\{h_X^{1,0}, \dim X\}$  and that  $p > \max\{i+1,3\}$ . Then the mod p homology cover  $Y \to X$  satisifes  $\operatorname{ed}(Y/X; p) \geq i$ . In particular, if  $p > \max\{h_X^{1,0} + 1, 3\}$  then

$$\operatorname{ed}(Y/X; p) \ge \min\{h_X^{1,0}, \dim X\}$$

*Remark.* Note the bounds are exactly those in Theorem C part (c).

*Proof.* An in the proof of Theorem D, let  $X' \to X$  be a finite connecting covering of degree prime to p over  $\eta$  and let  $\eta' \in X'$  be the generic point. Let  $G = \operatorname{Gal}(Y/X)$ , and consider the composite map

$$\wedge^{i}H^{1}(G,\mathbb{F}_{p}) \xrightarrow{\sim} \wedge^{i}H^{1}_{\text{\'et}}(X,\mathbb{F}_{p}) \to H^{i}(\eta,\mathbb{F}_{p}) \to H^{i}(\eta',\mathbb{F}_{p})$$

By Theorem C, the second map is nonzero assuming  $i \leq h_X^{1,0}$ . The last map is injective since  $X' \to X$  has degree coprime to p over  $\eta$ . Since the compositie map factors through  $H^i(G, \mathbb{F}_p)$ , it follows that

$$H^i(G, \mathbb{F}_p) \to H^i(\eta', \mathbb{F}_p)$$

is nonzero, which implies that  $\operatorname{ed}(Y/X;p) \geq i$  as in the proof of Theorem D.

**Corollary 4.6.2.** Let X be a projective C-scheme with unramified good reduction at p. Let  $b_1 = \dim_{\mathbb{Q}} H^1(X, \mathbb{Q})$  and suppose  $p > \max\{\frac{1}{2}b_1 + 1, 3\}$ . Then the mod p homology cover  $Y \to X$  satisfies

$$\operatorname{ed}(Y/X; p) \ge \min\{\frac{1}{2}b_1, \dim X\}$$

*Proof.* Since X is projective, we have  $h_X^{1,0} = h_X^{0,1} = \frac{1}{2}b_1$ . Thus we reduce to the previous result.  $\square$
